# Aims of doing economics

- Assess whether the project is economically viable  
评估项目的经济可行性
- Compare CCS with alternatives  
对比CCS和其他减排技术
- Design of CCS projects (trade-offs)  
对比不同的CCS项目方案（权衡取舍）

# Aims of presentation

- To show:
  - how to calculate CCS costs
  - some of the factors that affect CCS costs
  - how to use economics to compare different CCS projects
  - how economics can be used to make business and investment decisions for CCS

# Outline

## Part I - Economic methodology

- Cash flow analysis (现金流分析法)
- Present value (现值)

## Part II - Measures of CCS economics

- CO<sub>2</sub> avoided (清除的CO<sub>2</sub>)
- \$ per tonne CO<sub>2</sub> avoided (清除每吨CO<sub>2</sub>的单位成本)

## Part III - Evaluating CCS projects

- Main factors affecting CCS costs
- Factors affecting capture costs
- Factors affecting transport and injection costs

# Cash flow analysis

China Australia Geological Storage of CO<sub>2</sub>  
中澳二氧化碳地质封存

All rights reserved

# Cash Flow

- Cash flow is the cash received and the cash spent over a defined period of time

$$\text{Net cash flow} = \text{cash received} \\ \text{less} \\ \text{cash spent}$$

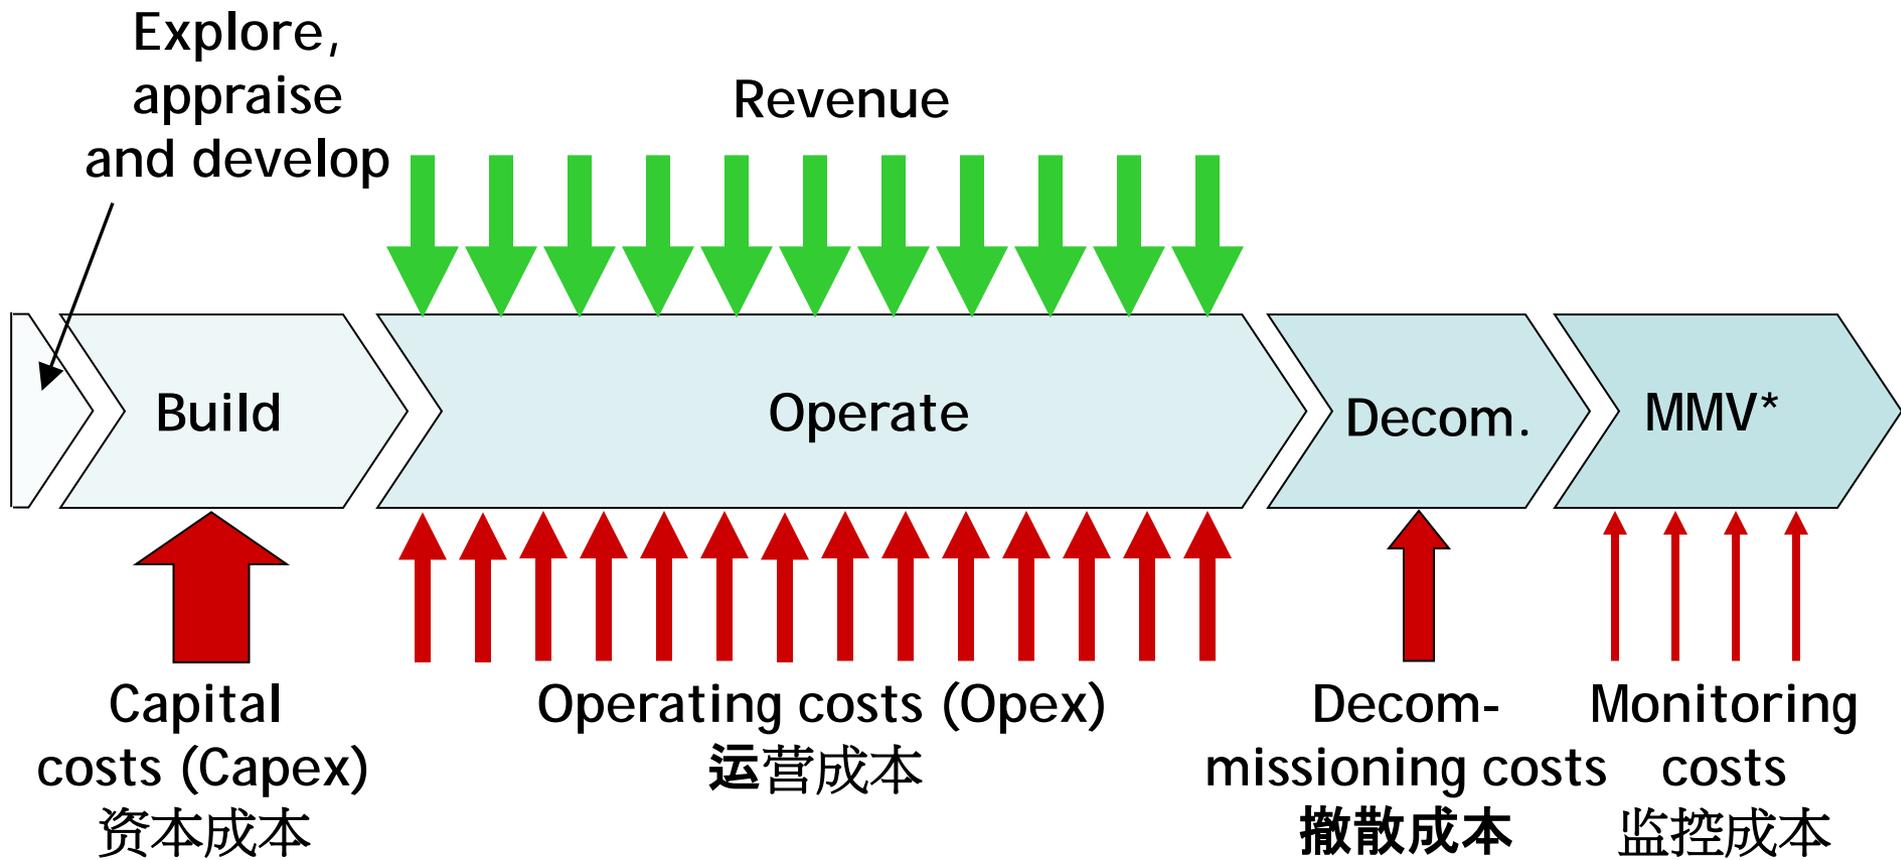

# Why use cash flow?

- It is simple.
- Projecting cash flow allows revenues and costs to change over time.
- The effect of tax, inflation and other costs can be added or changed over time.

# Components of CCS cash flow

\*MMV = Measurement, Monitoring & Verification

China Australia Geological Storage of CO<sub>2</sub>

# Typical CCS project cash flow

Build (2-3 yrs)	Operate (20-40 yrs)	Decom. (1+ yrs)
	Revenue (sales, carbon price)	
Capex	Opex	Decom. costs
Purchase and install capture plant, compressors, pipelines, platforms, drill and complete wells	Energy, material costs, cooling water, maintenance, office overheads, insurance, labour, etc.	Plugging and abandoning wells, site remediation, platform removal, etc.
Net Cash Flow		

# Example of a CCS project cash flow

- A CCS project has -
  - a capital cost of \$600 million
  - an operating cost of \$90 million per year
  - a decommissioning cost of \$140 million
- Project life is 28 years (2 yr build, 25 yr operate, 1 yr decommissioning).

# CCS project Cash Flow (\$ million)

Year	1	2	3	4	....	27	28
Capex	200	400					
Opex			90	90	....	90	
Decom. costs							140
Project cash flow	-200	-400	-90	-90	....	-90	-140

# Present Value

China Australia Geological Storage of CO<sub>2</sub>  
中澳二氧化碳地质封存

© CO2CRC  
All rights reserved

# Present value of project costs

- We use present value to represent future costs on the same basis
- PV is the equivalent value of the costs today
- It is the amount of money we would need to invest today in a bank to enable us to meet the costs of the project when they are due

## Discount rate (贴现率)

- In general, the discount rate is the return we would get on an alternative investment.
- For example -
  - Bank
  - Shares on the stock market
  - Company's own shares

# Calculating Present Value

Discount rate =  $d\%$

$$\text{Present value} = \frac{\text{\$ in year } n}{(1+d\%)^n}$$

- Discount rate = 7%
- What is the present value of \$100 received after one year?
- $PV = \$100 / (1+7\%)^1$   
 $= \$93.5$

# Calculating Present Value (\$ million)

Year	1	2	3	....	27	28
Project cash flow	-200	-400	-90	....	-90	-140

Present values (7%)

-187

-349

-8

:

-2

-21

Present Value of project costs = sum PVs = -1,473

# Net Present Value (PV)

- It is the present value of project net cash flow.
- It represents the project by a single number and takes time into account.
- It is the amount of money we would need to invest today in a bank to enable us to meet the costs of the project over the entire project life.

# CO2CRC methodology

- Uses PV method and cash flow analysis over the project life because it is flexible.
  - Allows us to spread capital costs over several years
  - Allows costs to change over time
  - Allows us to change or add variables over time

# Measures of CCS economics

## CO<sub>2</sub> avoided

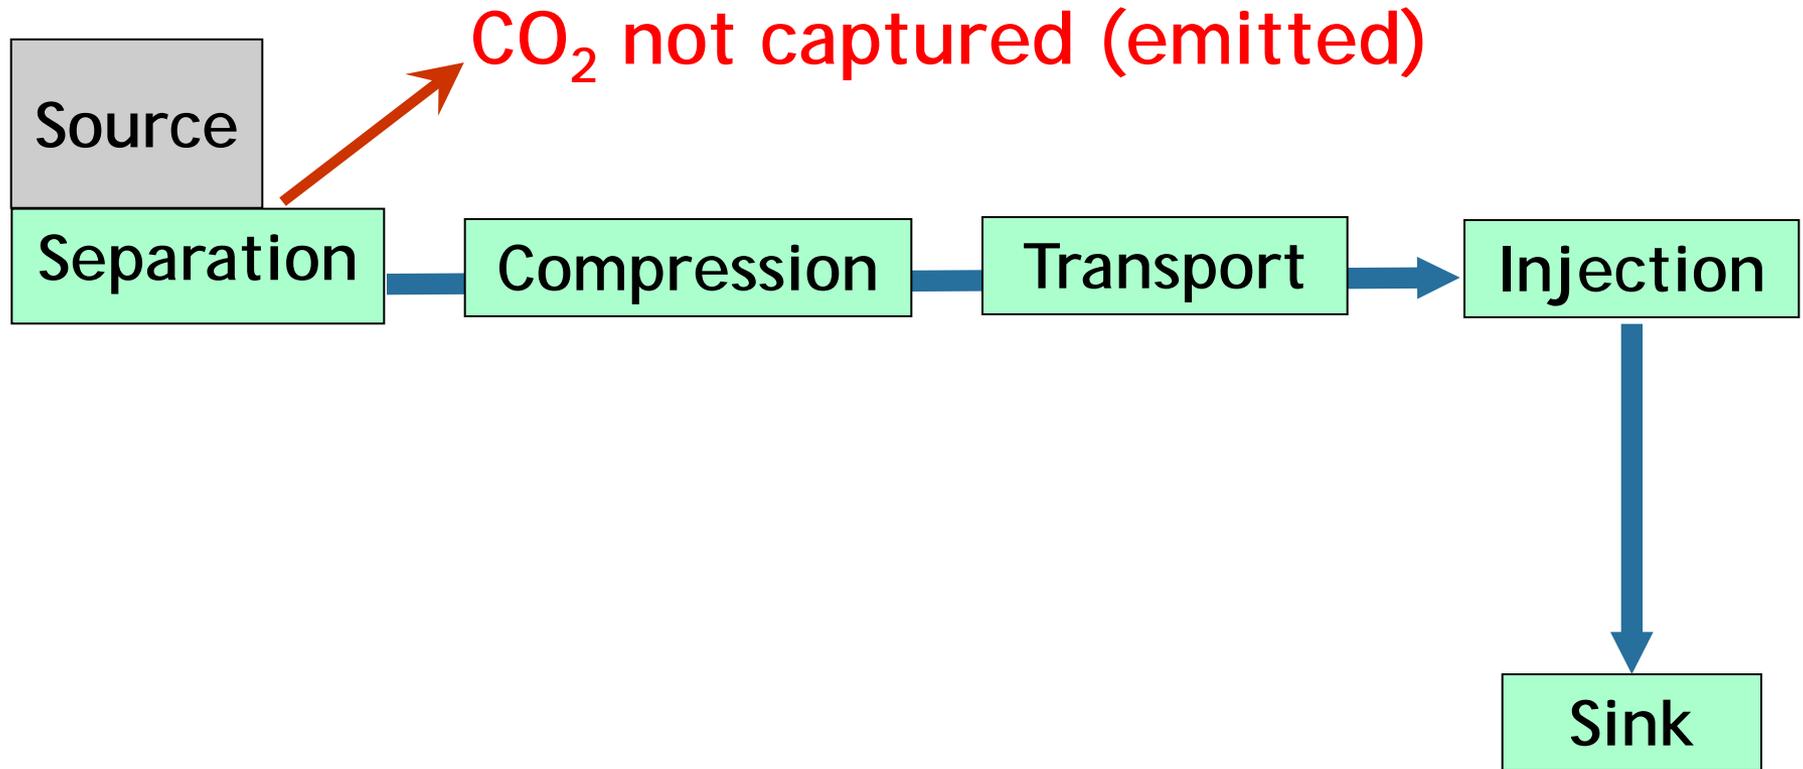

China Australia Geological Storage of CO<sub>2</sub>  
中澳二氧化碳地质封存

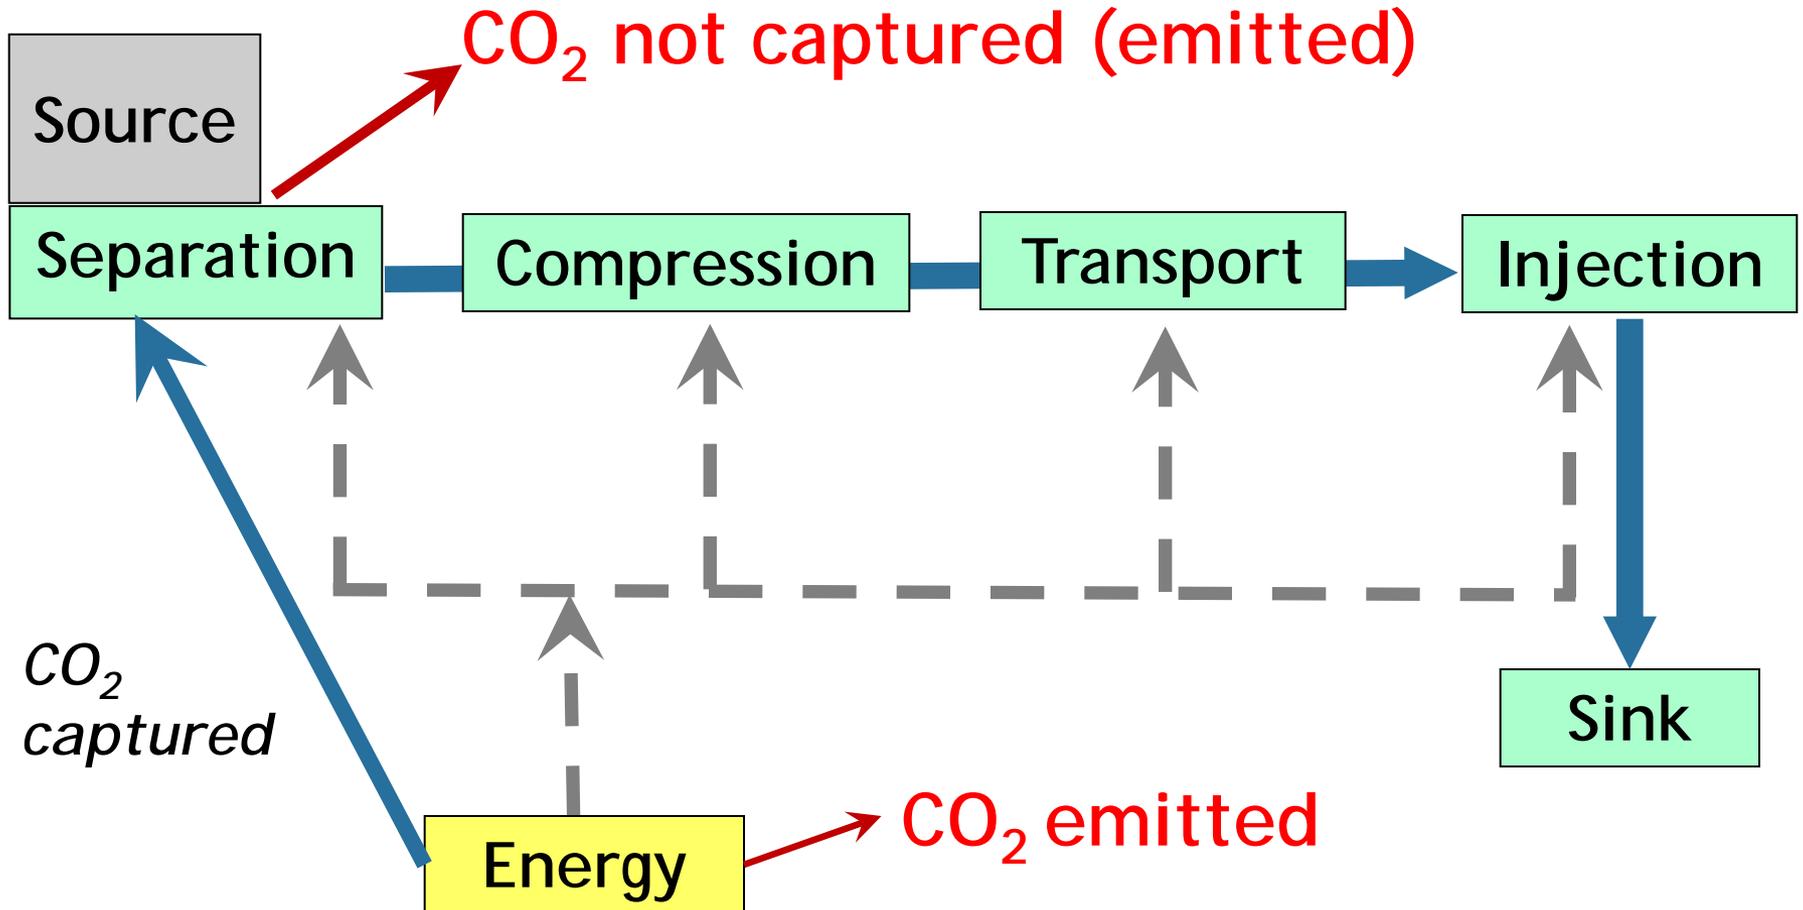

© CO<sub>2</sub>CRC  
All rights reserved

# Generic CCS process

# Generic CCS process including energy

# CO<sub>2</sub> avoided

CO<sub>2</sub> avoided = CO<sub>2</sub> emitted without CCS

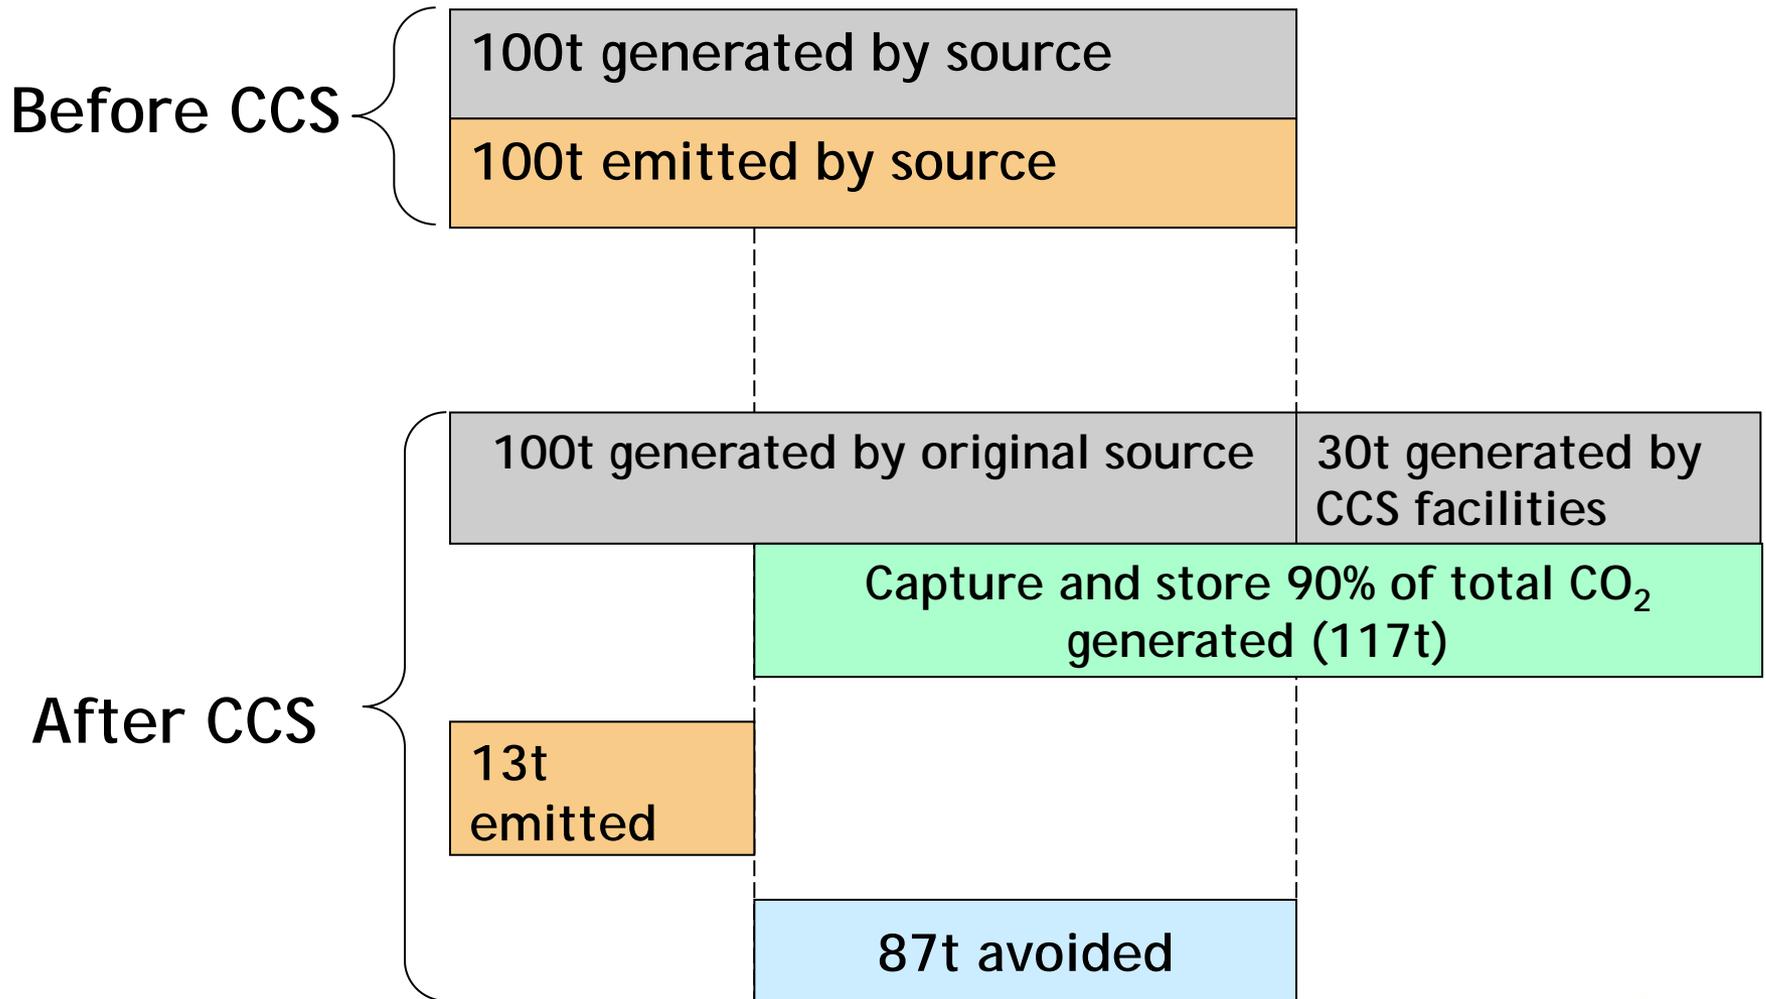

less

CO<sub>2</sub> emitted with CCS

The amount of CO<sub>2</sub> avoided is different from the amount of CO<sub>2</sub> captured and stored!

# CO<sub>2</sub> avoided by CCS

# Measures of CCS economics

## \$ per tonne CO<sub>2</sub> avoided

China Australia Geological Storage of CO<sub>2</sub>  
中澳二氧化碳地质封存

© CO<sub>2</sub>CRC  
All rights reserved

# \$ per tonne CO<sub>2</sub> avoided

- Specific cost of CO<sub>2</sub> avoided
- Describes overall CCS project costs
- Using PV -

$$\begin{aligned} \text{\$ per tonne CO}_2 \text{ avoided} = & \\ & \text{PV of all costs for CCS} \\ & \text{divided by} \\ & \text{PV of CO}_2 \text{ avoided} \end{aligned}$$

# Cash flow for CCS

Year	Present Value	1	2	3	....	27	28
Project costs (\$ million)	1,473	200	400	90	....	90	140
CO <sub>2</sub> avoided (million tonnes)	31			3	....	3	

$$\begin{aligned}
 \text{\$ per tonne CO}_2 \text{ avoided} &= 1,473 / 31 \\
 &= \text{\$48 per tonne avoided}
 \end{aligned}$$

# Warning

- CO<sub>2</sub> avoided is different for CCS, capture alone and storage alone
- Therefore can't add capture \$/t avoided to storage \$/t avoided
- Do calculation on whole process

# Factors affecting CCS costs

China Australia Geological Storage of CO<sub>2</sub>  
中澳二氧化碳地质封存

© CO2CRC

# Economic factors

- Discount rate
- Project life
- Fuel costs
- Exchange rate
- Capex, Opex and Decom. costs

# Effect of assumptions

# Project specific factors

Capture	Transport	Injection
CO <sub>2</sub> concentration	CO <sub>2</sub> concentration	CO <sub>2</sub> concentration
Flow-rate	Flow-rate	Flow-rate
Source type	Distances	Areal extent
Capture method	Onshore or offshore	Formation properties
Source temperature	Land use	Injection well type
Source pressure	Topography	Exploration
...	...	...

# Factors affecting capture costs

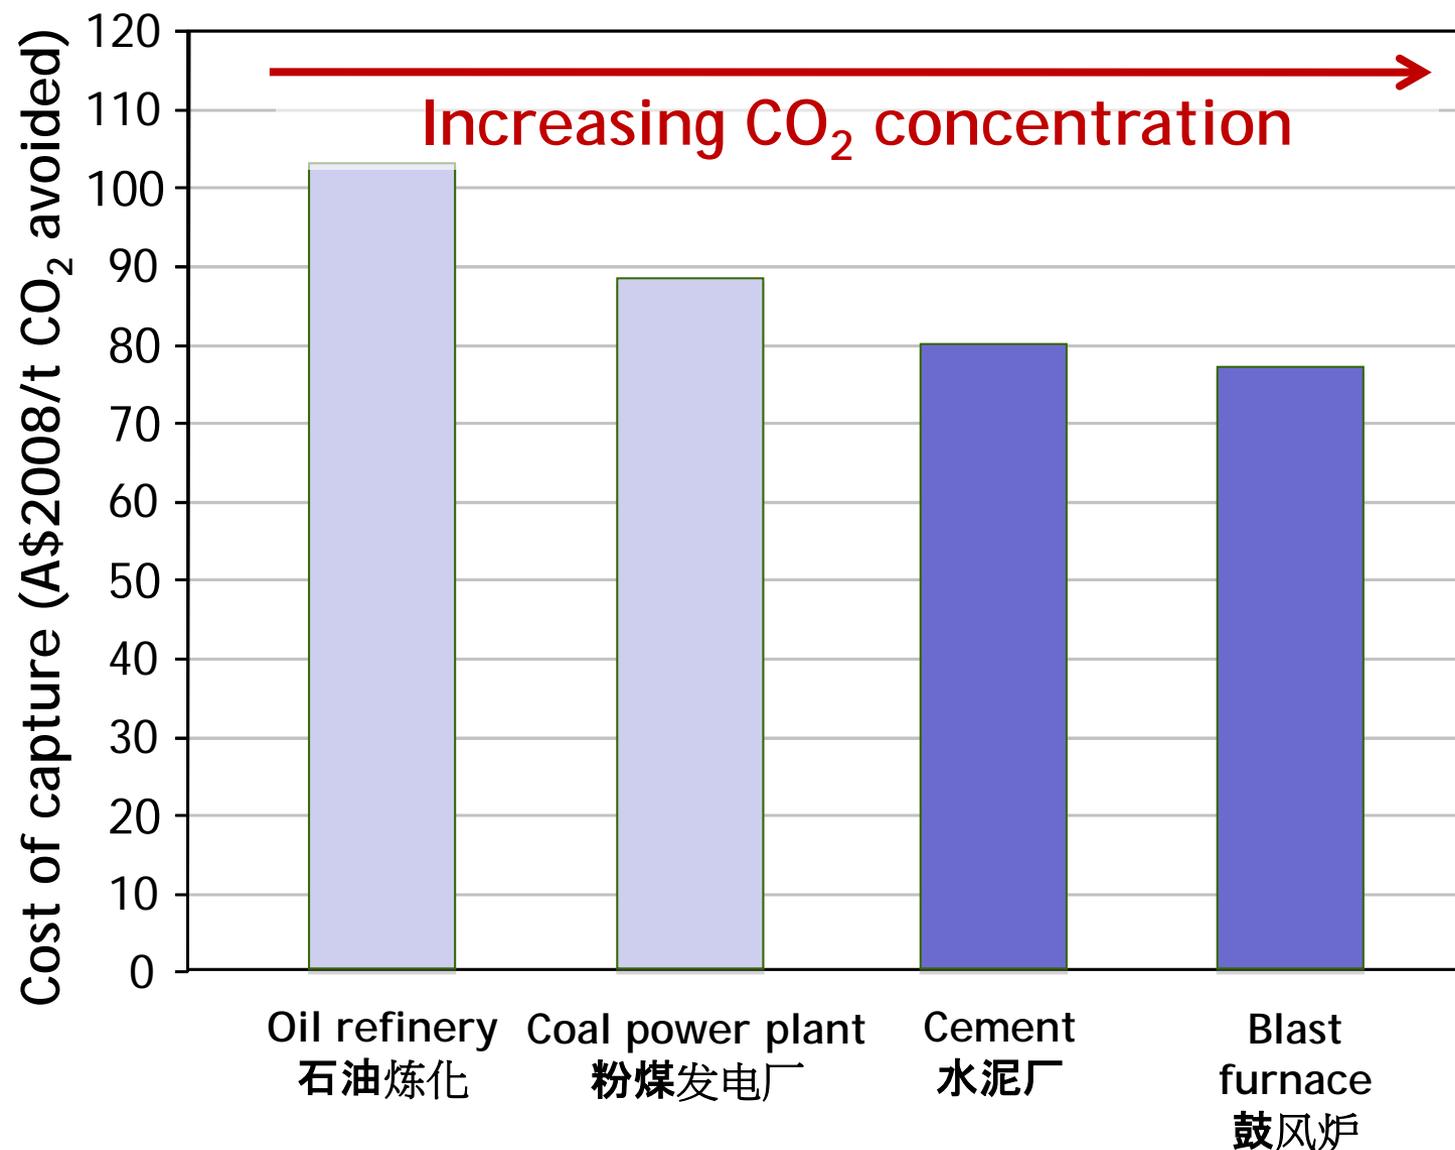

China Australia Geological Storage of CO<sub>2</sub>  
中澳二氧化碳地质封存

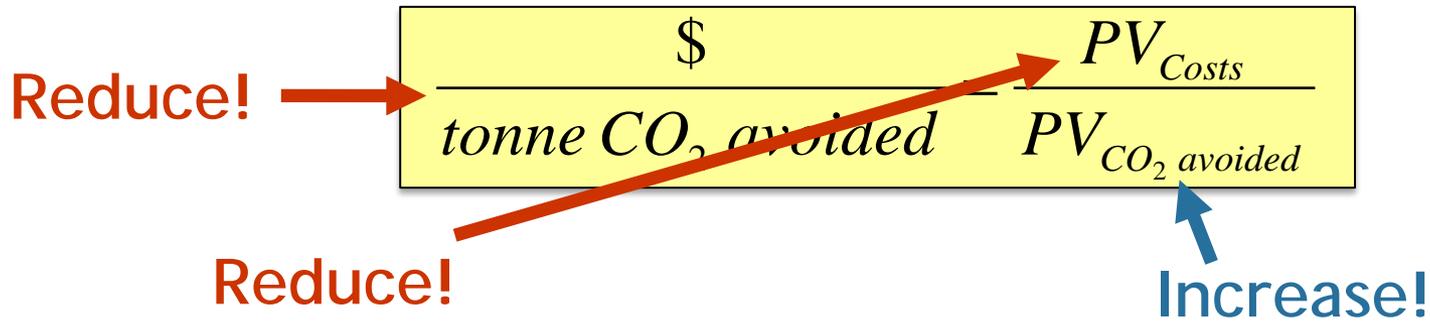

© CO2CRC  
All rights reserved

# Effect of CO<sub>2</sub> concentration

# Reducing capture costs

- **Reduce Capex** - cheaper equipment
- **Reduce Opex** - more efficient equipment, less energy demand
- **Reduce energy required by capture** - use improved technologies, heat and process integration
- **Increase CO<sub>2</sub> captured** - improve capture rate
- **Reduce CO<sub>2</sub> emitted** - improve process efficiency, change fuel
- **Increase energy efficiency** - heat and process integration

# Example: Effect of improving capture technology

- Compare the energy requirement and costs using MEA or KS1 solvent absorption

Solvent	Solvent loss (kg solvent / tonne CO <sub>2</sub> captured)	Steam used (kg steam / kg CO <sub>2</sub> captured)	CO <sub>2</sub> avoided (tonne / MWh)	Capture Cost (A\$2008 / tonne CO <sub>2</sub> avoided)
MEA	1.6	1.8	0.500	65
KS1	0.35	1.5	0.542	53

# Factors affecting transport and injection costs

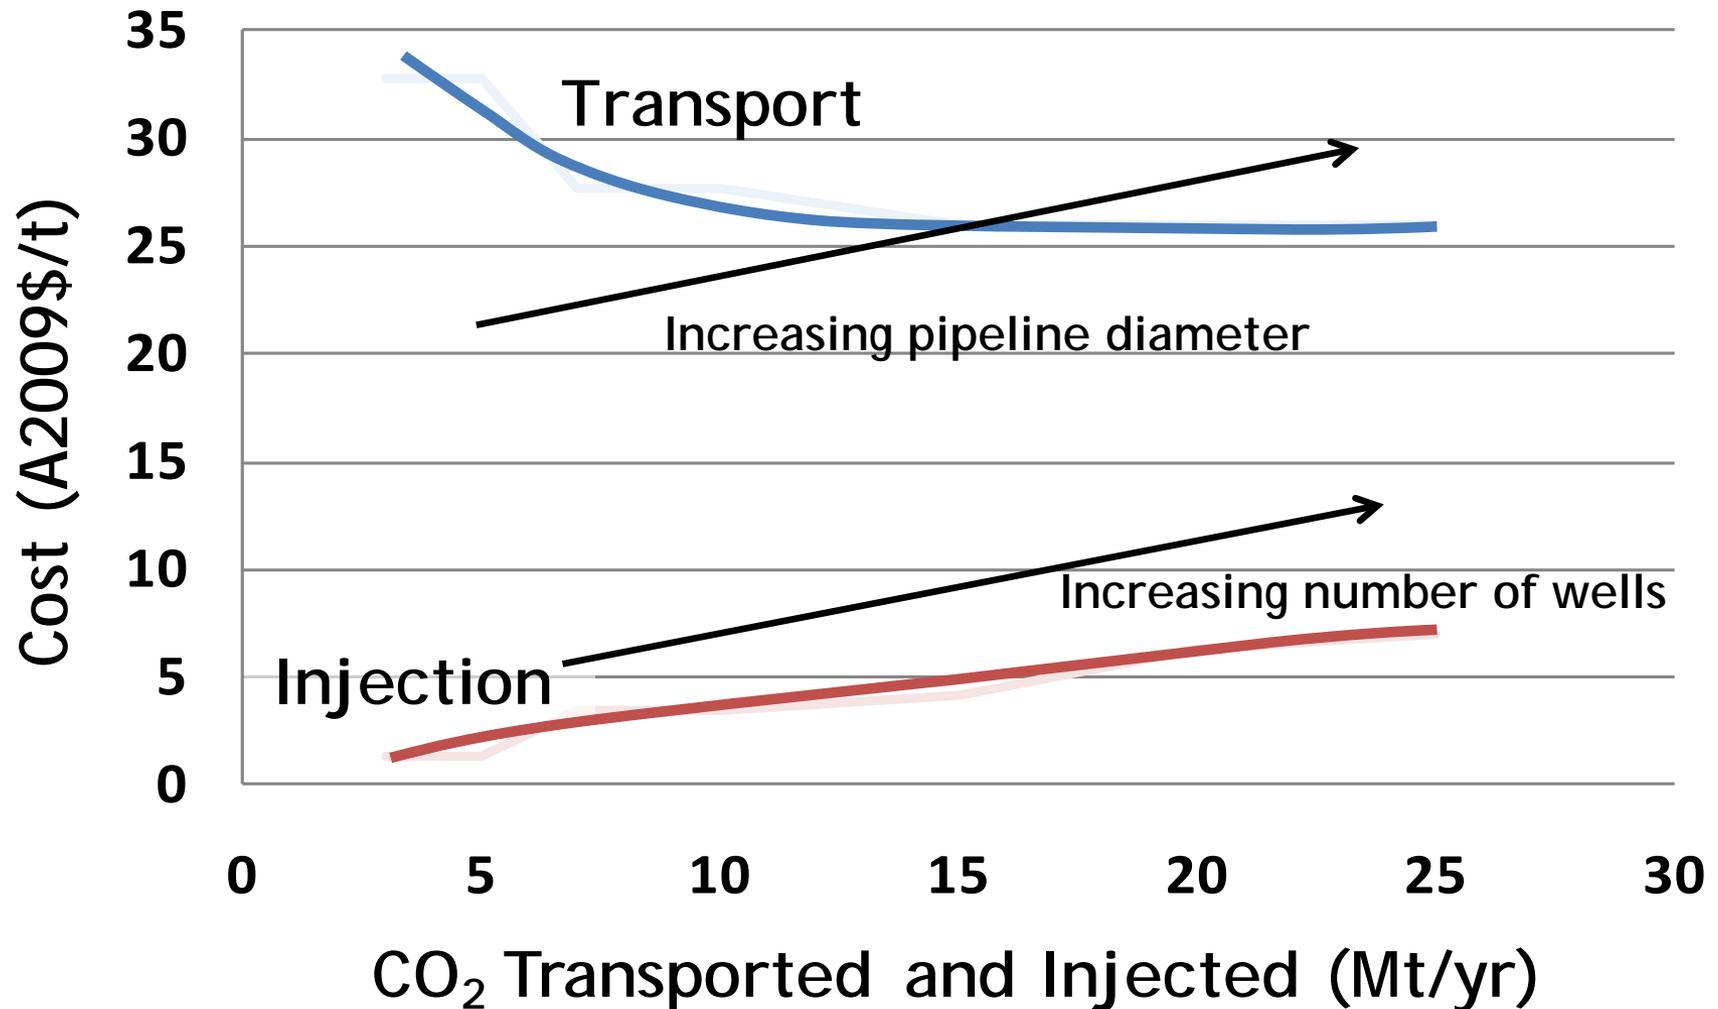

China Australia Geological Storage of CO<sub>2</sub>

## Summary

- Represent costs over time using cash flow and present value

用现金流和现值表示一段时间的成本

- \$ per tonne CO<sub>2</sub> avoided gives the cost of avoiding emissions (breakeven)

每吨CO<sub>2</sub>的清除成本代表了清除二氧化碳排放的成本（盈亏平衡所需碳价）

- CCS costs are project specific

CCS的成本由项目特定因素决定
