**CAGS Technical Workshop**  
Canberra 18<sup>th</sup> – 22<sup>nd</sup> January 2010

Dr John Bradshaw  
Chief Executive Officer  
CO<sub>2</sub> Geological Storage Solutions  
[www.cgss.com.au](http://www.cgss.com.au)

**GEOLOGICAL STORAGE: CHALLENGES AND OPPORTUNITIES**

"It's not just a technical problem"

The Sleipner CO<sub>2</sub> injection into the Utsira Formation at 1000 Meters Below Sea Bottom - About 1 million tons/yr -

**Geography of Sleipner**

**Permeability**

- 1621 to 3252 mD (locally)
- 1100 to 84,0md regionally

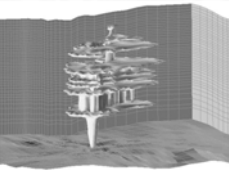

**Porosity**

- 36 to 4,0%

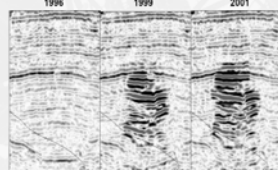

**Size**

- 26,000<sup>3</sup> km
- 100s yrs emissions

**Reservoir model of CO<sub>2</sub> after 3 years**

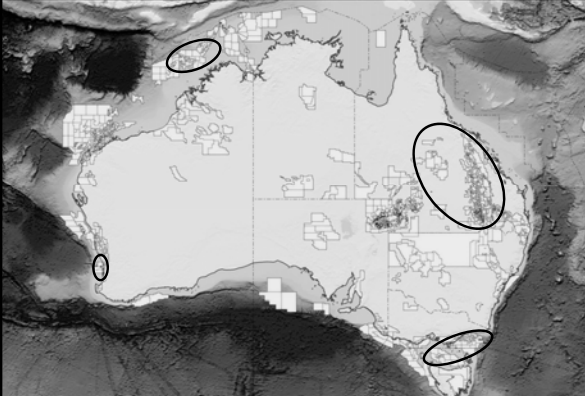

**3D Seismic survey at Sleipner**

**POLICY & LEGAL**

Issue : Policy & legal are way bigger than people appreciate?

**Petroleum Leases versus areas of interest for Storage**

**Queensland Permit Overlap**

Petroleum + CBM

Geothermal

Mineral Exploration

Coal + UCG

### Injection scenarios?

- Consider how the following scenarios (geo-cartoons to follow) impact on;
  - technical, regulatory and legal aspects?
- Structural (physical) trapping
- Chemical trapping
- Migration pathways
- Pressure transmission

### Conceptual CO<sub>2</sub> Storage Scenario

depleted field / structural trap

Assigning permits relatively easy – tightly constrained

But what if hydrocarbon discovery already exists, or believed to exist in structure?  
EOR - Sequenced development?

Or hydrocarbons found later - Which operator? – Who gets priority?

### Conceptual CO<sub>2</sub> Storage Scenario

hydrodynamic / residual gas / solution trap (MAS – Migration Assisted Storage)

Where do you put permit boundaries?

How big do you make permits?

What access rights do you employ?

What if there are two storage operators – co-mingling of CO<sub>2</sub>?

### What about where Storage won't scale up locally?

- Oil & Gas Resources “uneven distribution”
- Long Pipelines
- Ship Transport
- Right strategy needs implementing based on reality of local geology
  - Long Pipelines & Ship
  - Non-coal energy source
- The value placed on CO<sub>2</sub> will influence the above;
  - Either socially, financially or inter-generationally

**THIS IS JUST A TECHNICAL (SCIENCE & ENGINEERING) CHALLENGE .. ISN'T IT?**

... plus getting the economics right to do it ...

**Reservoir development**

- Continuity – channel sands
- Pressure communication
  - overbank deposits, crevasse splays
- Thickness (1 - 2 m channels)
- Quality – clays & choked pore throats
- Build regional reservoir model for simulation
- ? SEAL DEVELOPMENT ?
  - no big marine transgression (flooding)

**Braided Stream Deposits**

1. Channel sands
2. No continuous sealing surfaces.
3. Not sure of reservoir inter-connectivity
4. Multiple vertical migration path for buoyant fluids

Sandstone Injection Point Siltstone

Can we model such complex and tortuous migration pathways ?

Are our reservoir simulators up to it?

How many wells required to fill this pore space

**Reservoir & seal**

- Extensive
- Thick
- Stacked reservoirs
- Good quality
- Intraformational seals
- Offshore

**Niger Delta**

**Ceduna delta**

Listric faults

Smaller field sizes and geomechanics issues

Numerous oil fields

*Doust & Omatsola 1990; Cohen & McClay 1996*

III Depositional Environments

- Highly variable
- But predictable
- Need good modern analogues to compare to the ancient rocks
- Conventional Petroleum Geology production issues
- Normal Reservoir Engineering challenges
- **Again; ..... this is just doing our homework properly – normal business practices**

CBS

**If we scale up – the detail in the rocks is where the real battle will be fought !**

..... and that is another story yet to be told ....

..... but some of us have had a sneak preview ....

**What about the number of wells required?**

Issue : We must pay a lot of attention to well numbers

... it could be embarrassing (costly) if we get this one wrong ....

**No.'s of Wells vs Reservoir Quality**

INJECTION REQUIREMENT	Mt CO <sub>2</sub> / year	Environment, Age & Depth	No. of Wells	Reservoir Quality	Wells for 10 Mt CO <sub>2</sub> PP
"Best" Coal	0.002 to	Coal	1	Very very poor	531
Highly dependent on		•Depth and age	1	Superb 30 - 3000 mD	10
		•Environment of deposition		Very Poor 5 - 45mD fractured	30
		•permeability x thickness	3 (2) (horiz rates)	Good 50 - 250 mD	50 ?
		•assumption production		Good 50 - 250 mD	50
		•vertical vs horizontal	10 (horiz rates)	Superb multi D	2.3 (5?)
		•reservoir stimulation		Superb multi D	2.5
M		•onshore vs offshore	5	Very Good 10 mD (to D's)	5
		•reservoir heterogeneity (capacity)		???	
P		•multiple perforation	5		
		•pressure – build up, long term reliability			

Exists – Proposed – Modelled – Problematic

## Conclusions

- Issues include;
- Policy, Technical, Legal, Regulatory & Financial
- ... and their interactions ....
- Beware of;
- Well numbers, .... and
- Costs
- Need to;
- *“Engineer the reservoir”* due to scale of problem

## Reservoir Pressure Build up

“If a site is of poor quality in terms of permeability (and thus can only accept small rates of injection), but has a lot of pore space and potential storage volume, then there will be a limit to the rate at which the CO<sub>2</sub> can be injected for each well. This may limit its utility as a storage site because it will require large capital costs for many wells and compressors, and, hence, quoting such a site as having large storage capacity may be extremely misleading.”

Source: Bradshaw, et. al. 2007. CO<sub>2</sub> Storage Capacity Estimation: Issues and development of standards. International Journal Greenhouse Gas Control 2007:62-68

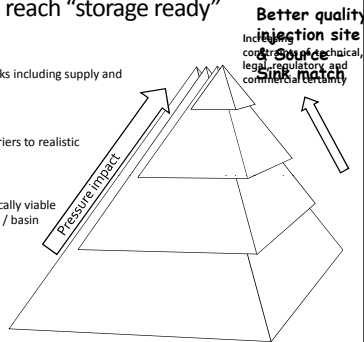

## Storage Capacity Resource Pyramid: requirements to reach “storage ready”

**Matched capacity:**  
Detailed matching of sources and sinks including supply and reservoir performance assessment

**Practical (Viable) capacity:**  
Applies economic and regulatory barriers to realistic capacity,

**Effective (Realistic) capacity:**  
Applies technical cut off limits, technically viable estimate, more pragmatic, actual site / basin data

**Theoretical capacity:**  
includes large volumes of “uneconomic” opportunities. Approaches physical limit of pore rock volume ; unrealistic and impractical estimate

Bradshaw et al 2002; Bradshaw et al 2007; Bachu et al 2007

## Reservoir Pressure Build up

- Bert van der Meer (GHGT9 – November 2008)
  - Invaded space
- Van der Meer & Yavuz (2009)
  - up to a tenfold reduction in the proposed injection plan
  - threefold reduction compared with the earlier estimations of storage capacity when pressure build up was not taken into account
- Birkholzer et al (2009)
  - plume occupied a radial area of less than 2 km
  - pressure front with considerable pressure build up extended laterally for over 85 km with an area of influence of 22,000 km<sup>2</sup>

## Reservoir Pressure Build up

- Birkholzer and Zhou (2008)
  - Mt Simon Sandstone
  - pressure build-up over a large area - 15,000 km<sup>2</sup>
  - previous theoretical storage capacity estimates based on application of storage efficiency factors and Monte Carlo simulation) ranged from 27,000 to 109,000 Mt CO<sub>2</sub> (USDOE, 2008)
  - geomechanical constraints are placed on by regulators, then the storage capacity may not achieve the modelled values of 5,000 to 13,000 Mt CO<sub>2</sub>

## Reservoir Pressure Build up: considerations

- fracture pressure
  - limitations that may have on storage capacity
  - Impact on injection rate, well numbers & cost
- regulatory regime
  - impact of large scale injection
- entire hydrologic regime
  - will need to be monitored
- Where pressure draw down has occurred due to production of groundwater
  - pressure build-up may be a benefit
  - provided saline water does not mix with the freshwater systems
- consider the use of pressure relief wells
  - Adds to cost

### GAPS & CHALLENGES

### Some Gaps & Challenges ?

- **Trained staff**
  - to take up the challenge
- **Reliable Storage Capacity Estimates (Country level)**
  - impact on Gov't policy
- **Lower Capture costs (power stations)**
  - up to 50 - 60% expected
- **Government regulations & Storage permit access**
  - Competing resources (water + hydrocarbons), Economic regime (incentive to invest), Land tenure, OHS, etc
- **Access to data (digital)**
  - Well, seismic, production
- **Commercial Scale Sites**
  - Learn by doing
- **Public Acceptance**
  - otherwise go nowhere
  - need Geoscientists to engage in the debate

**Gone past time for immediate action**
